HEALTHY BREASTS ~ PREVENTION vs DETECTION

October is Breast **CANCER** Awareness Month

Early screening with Thermology can detect breast tissue changes at a minute physical stage of development, as much as **5-8 years earlier** than mammography or other conventional testing. This is when breast tissue changes, inflammation or even cancer is still relatively easy to halt and reverse. The time to be proactive about breast cancer prevention and your breast health is before later stage cancer is detected. And earlier detection is now available and safe for everyone: every size, shape or density.

Your life-saving, best choice and safest choice for early screening is Thermography which detects natural heat emission from the body by taking digital computerized pictures:

NO TOUCHING, NO PAIN, NO COMPRESSION, NO RADIATION

Thermography Easy and Safe

Say **NO** to radiation

Say **NO** to compression

Say **NO** to pain

Say **NO** to contact

Say **YES to the earliest
detection** of functional
physiological changes!
